Services	General contractor services (GC)
Construction	2023
Locality	Biwer
Country	Luxembourg

Public toilet facilities with utility room

Blumer Lehmann erected the public toilet facilities with utility room in Biwer's village square as general contractor. The building was constructed in a modular timber design and clad with a timber facade made of Swiss TMT.

The public building is part of the redesign of Biwer's village square. The single-storey modular construction consists of just one module and was integrated between an existing building and a natural stone wall.

The module contains an accessible toilet, a unisex toilet and a vestibule with a water dispenser, as well as a utility room for the village square's water feature that has a separate access.

Harmonious addition: with its facade made of untreated, planed TMT, the modular timber construction also blends in well with the colours of its surroundings.

The modular timber design made it possible to implement the public building quickly and adapt it flexibly to the surrounding design.

The new building with public toilet and utility room consists of just one timber module and fits perfectly between the existing building and the wall.

Accessible: the new facility has a wheelchair-accessible toilet and are accessible at ground level.

Timber module in the village square

Biwer, LU

The public toilet facilities were erected as part of the redesign of the village square.

The newly constructed toilet facilities complement the existing buildings around Biwer's village square.
